

Seigler Building & Development — New Website Performance Report

Reporting period: July 6 – September 15, 2026 (first ten weeks on the new site), measured against the ten weeks before launch

Ten Weeks In

The new Seigler website went live on July 6. Rather than wait for another calendar month to close, this report looks at the whole stretch since launch — July 6 through September 15 — and sets it against the identical ten weeks immediately before, when the old site was still running. Same length of time, same season, same market. The only thing that changed is the website.

That makes this the cleanest read we will get on whether the rebuild earned its keep. The short answer is yes, and the reason is more interesting than the headline.

The Ten-Week Picture

- Website visits: **2,146**, up from 1,720 — a **24.8%** increase
- Engaged visits (people who actually did something, rather than bouncing): **1,216**, up from 886 — a **37.3%** increase
- Engagement rate: **56.7%**, up from 51.5%
- Average time per visit: **40 seconds**, up from 34
- Organic search visits (people who found you on Google without an ad): **331**, up from 158 — **more than double**
- Google search impressions: **19,600**, up from 6,560 — **three times as many**
- Clicks from Google search results: **234**, up from 112
- Average Google ranking position: **23.7**, improved from 28.6

Notice that engaged visits grew faster than visits did, and time-on-site grew alongside both. Traffic going up is easy to buy. Traffic going up *while people stay longer and go deeper* means the site itself is doing more work.

Inquiries: The Number That Matters

For a business where a single project runs well into seven figures, visit counts are a means, not an end. The real measure is how many people fill out the form and ask about building a home.

Here is the monthly count of website inquiry forms submitted, drawn straight from the site's own records:

MONTH	WEBSITE INQUIRIES	SITE
May 2026	1	Old site
June 2026	1	Old site
July 2026	5	New site (from the 6th)
August 2026	7	New site
September 2026 (through the 15th)	5	New site

One a month became roughly six a month. September was already at five inquiries by the halfway mark. Across the ten weeks since launch the site produced **17 inquiries**, against two in the ten weeks before it.

These are not casual note-writers. They arrive naming a specific lot or community — Sharps Channel, Tellico Village, Dudala Way in Loudon, a parcel in Rutledge — and several are relocating from out of state with land already purchased. That is the profile of a buyer who has moved past daydreaming.

Where the Growth Actually Came From

This is the part worth reading twice.

Traffic arriving through **organic search** — people who found the site on Google without an ad being involved — more than doubled, from 158 visits to 331. But the volume is not the story. The behavior is:

- Organic visitors stay an average of **1 minute 17 seconds** — more than double the site-wide average

- Their engagement rate is **69.8%**, the highest of any traffic source
- They now account for the **largest single share of all contact activity** on the site — phone taps, email clicks and form starts combined

Organic search delivers roughly one in seven visits but a disproportionate share of the people who actually reach out. Someone who searched for a custom builder, read through the results, chose Seigler and clicked is further along than someone who tapped an ad. The new site is finally able to reach that person, because before the rebuild Google had very little to show them.

The plain-English version: the website is no longer just a brochure that advertising points at. It has become a source of qualified inquiries in its own right — and the people it brings in on its own are the most engaged visitors the business gets.

New Ground on Google

Google now shows the site for **811 different searches**, three times as often as before the rebuild, and ranks it nearly five positions higher on average.

The most useful detail is *which* searches. These are the biggest gains since launch, most from a standing start of zero:

SEARCH TERM	SINCE LAUNCH	BEFORE LAUNCH
luxury home renovations	872	609
luxury home remodel	298	187
luxury remodels	279	1
luxury home remodeling	267	104
luxury home renovation	162	51
custom homes lakes area	159	0
luxury custom homes in lenoir city	148	0
custom builder sequoyah hills	98	0
luxury mountain home builder sevier county	96	0

SEARCH TERM	SINCE LAUNCH	BEFORE LAUNCH
sequoyah hills custom builder	89	0

The place-name searches are doing exactly what they were built to do. Sequoyah Hills, Lenoir City, Sevier County, the lakes area — these are searches where the site had no presence whatsoever before July, and they are precisely the addresses this business exists to build at. Someone searching "custom builder sequoyah hills" has a neighborhood in mind and a budget to match.

There is a second pattern here that was not anticipated, and it is the most commercially interesting thing in this report.

An Unexpected Opening: Renovation

Five of the ten biggest gains above are **renovation and remodel** searches, not new-construction ones. "Luxury home renovations" alone drew 872 impressions. Together this cluster is the single largest source of new visibility the site has gained.

This is real, repeated demand from people looking for a builder of Seigler's caliber to take on a high-end renovation of a home they already own — often a substantial property in an established neighborhood where the land is irreplaceable and rebuilding is not the answer.

Right now the site surfaces for these searches almost by accident, on the strength of the Luxury Renovations page. There is no dedicated path guiding a renovation prospect from that search to a conversation. Building one is a straightforward piece of work against demand that has already proven it exists — and renovation projects tend to convert faster than ground-up builds, because the client already owns the site and the decision is narrower.

A Channel That Did Not Exist Last Year

Forty-seven visits arrived from **AI assistants** — people asking ChatGPT or a similar tool to recommend a custom home builder in East Tennessee and following the link it offered. The comparable figure for the ten weeks before launch was two.

Still small in absolute terms, but these visitors engage at well above the site average, and the direction of travel is unmistakable. More buyers are starting their search by asking an assistant rather than typing into a search box. The rebuilt site — with its detailed project pages, location pages and clearly structured information — is far easier for these tools to read and cite than the old one was. That is not a coincidence; it is a direct consequence of how the site was rebuilt.

The Advertising Alongside It

Paid search ran continuously through the period and continues to supply the largest single share of site traffic:

- Ad impressions: **24,501**
- Clicks: **1,434**
- Click-through rate: **5.85%**
- Average cost per click: **\$2.74**
- Visits delivered to the site: **1,318**

A 5.85% click-through rate is solid for this category, and the cost per click came down over the period. The campaign is doing its job of keeping the business in front of people actively searching for a builder.

Now that the site has ten weeks of its own performance data, there is a clear picture of which searches and which audiences produce the most engaged visitors — and the campaign can be tuned against that evidence rather than against assumptions. A restructuring is underway to concentrate spend on the highest-intent segments and to push harder on phone calls and direct inquiries, which is where this business converts. We will report on the results of that work in the next summary.

Where This Leaves Things

Ten weeks in, the rebuild has done what it was supposed to do. Visits are up a quarter, engaged visits up by more than a third, and inquiries have gone from roughly one a month to roughly six. The site is being shown on Google three times as often, across hundreds of searches it had never appeared in, and it is ranking better while it does it.

The most valuable finding is that the website has become a lead source rather than just a destination. Organic search — traffic the business is not paying for on a per-click basis — now produces the most engaged visitors and the largest share of contact activity on the site. That compounds. Search visibility built this way tends to hold and strengthen rather than stop the moment spending pauses.

Two clear opportunities sit in front of us: convert the visibility already won on neighborhood searches into actual clicks by strengthening those location pages, and build a proper path for the renovation demand that has surfaced on its own. Both are working with momentum that already exists rather than starting from nothing.
